

Each of the BSC-1s can be placed in approach mode using the JP1 jumpers. If you would like to do all of the signals at one time, you can wire them together. Install an On/Off switch near the power input. Connect one leg of the switch to the common terminal. Using blue wire, connect the other leg of the switch to the outside JP1 terminal on the closest board. Daisy chain the JP1 terminals on all the BSC-1 boards.
